GoDaddy Commerce Engineering (Mission Control)

Re: Senior Software Development Engineer, Pune

I've spent the last five years building and operating production systems across the full stack, React frontends and Node.js/Go backends on AWS, most recently handling millions of transactions a day at Razorpay. The Mission Control role caught my eye because it mirrors the kind of work I enjoy most: owning complex features end-to-end, working across the stack, and being responsible for what ships.

What's relevant:

At Razorpay, I led a Node.js → Go migration that cut latency by 30% and built distributed async pipelines (SNS/SQS/S3) processing 1.5M+ events daily, the sort of scale and reliability. I also executed a zero-downtime MongoDB → MySQL migration and frequently partnered with frontend engineers on API design for customer-facing billing experiences.

At Synechron (currently, with Emirates NBD), I'm building React dashboard for our tablet banking, designing ELK-based observability pipelines, and integrating Kafka for event-driven communication in a banking context. That on-call and incident response rhythm is familiar, I've been in rotation at both Razorpay and Synechron.

On the frontend-heavy aspect: I've built React apps (and React Native) throughout my career, from Razorpay billing UIs to internal banking dashboards to the full React + Vite frontend for ApiHealthz.com. I'm comfortable owning the frontend while also designing and shipping the backend services that power it.

On AI-assisted engineering: I actively use Claude Code, GitHub Copilot, and Opencode in my daily workflow, not as a vibe-coding tool, but to accelerate the parts of development that benefit from it. I'm glad GoDaddy sees this as a strength.

I'm based in Bengaluru and open to relocating to Pune for a hybrid arrangement.

Thanks for your time. I'd welcome the chance to talk more about how my background aligns with what Mission Control is building.

Best,
Pratik Sah
