Agile Labs

Re: Full-Stack Developer

I've spent the last five years building production systems end-to-end — React frontends, Node.js backends, and the glue in between. The full-stack developer role at Agile Labs caught my attention because of how deliberately it's written: strict TypeScript, functional programming, clean modular code, and collaboration with design teams. That's not a checklist I'm trying to match — it describes how I already work.

What's directly relevant:

At Razorpay, I owned TypeScript-first services in a team that took type safety seriously — discriminated unions, strict null checks, and functional patterns to keep billing logic predictable and testable. I wrote unit and integration tests (Jest) for payment-critical paths, partnered with frontend engineers on API design, and drove design reviews across microservices. That mix of backend rigour and frontend collaboration is exactly what this role asks for.

At Synechron (currently, client: Emirates NBD), I'm building and maintaining React-based UI components for internal banking dashboards, working closely with UX designers — which maps directly to your vendor and design team collaboration requirement. On the backend, I'm integrating Kafka for event-driven communication and designing observability pipelines, so I'm used to context-switching across the stack within the same sprint.

On React Native: I've shipped customer-facing React Native applications at Ethereum Covenant, integrated with Node.js REST APIs. Happy to lean into that if it becomes relevant.

On the learning culture: Agile Labs' description resonated with me. I actively use AI-assisted tools (Claude Code, GitHub Copilot) not as shortcuts, but to stay sharp and move faster on the parts of development that don't need to be slow.

I'm based in Bengaluru, open to remote and Pune.

Thanks for reading. I'd be glad to discuss how I can contribute to what Agile Labs is building.

Best,

Pratik Sah
